Persuasion under Subjective Causal Models

Can a sender exploit the way a receiver interprets information? I study persuasion when the receiver interprets the sender's signal through a subjective causal model, which the sender knows but does not control. The answer depends on whether the receiver regards the signal as a consequence of the state or as one of its causes. In the first case, the sender never gains from a signal that the receiver misinterprets: compared to a standard Bayesian persuasion benchmark, the sender is weakly worse off, and the receiver is never worse off than without information. In the second case, the receiver's posteriors across signal realizations might not average to the prior. The sender can then be strictly better off, and his gain is the receiver's loss: the receiver can be harmed by information that she values.
